The \texttt{upgreek} package for \LaTeX~2ε

Walter Schmidt\

(v2.0 – 2003/02/12)

The default CM math fonts used by \TeX do not include upright lowercase Greek characters, and many alternative math font sets don’t, either. (There are math fonts providing only an upright Greek alphabet, but that’s a different story.) However, mathematical constants such as $\pi = 3.14\ldots$ are sometimes required to be typeset in roman (i.e., upright) style, or one may need upright Greek to designate elementary particles.

As a workaround, the \LaTeX~package \texttt{upgreek} makes the upright Greek characters from the ‘Euler’ or ‘Adobe Symbol’ typefaces available as math symbols. The lowercase letters are named $\texttt{\upalpha}, \texttt{\upbeta}$ etc., whereas $\texttt{\Upsilon}, \texttt{\Upsilon}$ etc. create upper case.

Just like $\alpha, \beta$ etc., these symbols work only in math mode, and their size is properly adjusted, when they are used in superscripts, subscripts or fractions.

At first sight, providing also the uppercase letters seems pointless, since $\Delta, \Gamma$, etc. are also upright by default. However, it may be useful to have all upright Greek letters available in the same style. Note that the uppercase letters were intentionally not named $\texttt{\upDelta}$ etc., so as not to clash with other existent macro packages.

The typeface is selected using a package option, so you can choose what blends best with the other fonts used in your document:

[Euler] Euler Roman/Bold (default)

[Symbol] Adobe Symbol

[Symbolsmallscale] Adobe Symbol, scaled down to 90% of its natural size.

(New feature in version 2.0!)

Note that $\texttt{\upmu}$ should normally not be used as the prefix for physical units, meaning $10^{-6}$. The mu symbol to be used there is to be taken from the \textit{text} font, and most Latin text fonts do actually include a suitable Greek mu, which can be accessed as $\texttt{\textmu}$. Most likely – depending on the encoding of your text fonts – you need to load the package \texttt{textcomp} for this purpose. If, however, there is no mu in your text fonts, using $\texttt{\upmu}$ is still better than nothing. See also the \texttt{gensymb} package, which is distributed from the same CTAN directory than \texttt{upgreek}: It provides a command for ‘micro’ that works in both text and math mode and uses either $\texttt{\textmu}$ or $\texttt{\upmu}$, depending on the available character sets.
