The \texttt{l3str-format} package: formatting strings of characters

The \LaTeX{} Project\textsuperscript{*}

Released 2023-05-11

1 Format specifications

In this module, we introduce the notion of a string \texttt{(format)}. The syntax follows that of Python’s \texttt{format} built-in function. A \texttt{(format specification)} is a string of the form

\begin{equation*}
\texttt{(format specification)} = \texttt{[[\{fill\}][alignment]][\{sign\}][\{width\}][.\{precision\}][\{style\}]}$
\end{equation*}

where each \texttt{[ . . ]} denotes an independent optional part.

- \texttt{(fill)} can be any character: it is assumed to be present whenever the second character of the \texttt{(format specification)} is a valid \texttt{(alignment)} character.

- \texttt{(alignment)} can be < (left alignment), > (right alignment), \textasciitilde (centering), or = (for numeric types only).

- \texttt{(sign)} is allowed for numeric types; it can be + (show a sign for positive and negative numbers), - (only put a sign for negative numbers), or a space (show a space or a −).

- \texttt{(width)} is the minimum number of characters of the result: if the result is naturally shorter than this \texttt{(width)}, then it is padded with copies of the character \texttt{(fill)}, with a position depending on the choice of \texttt{(alignment)}. If the result is naturally longer, it is not truncated.

- \texttt{(precision)}, whose presence is indicated by a period, can have different meanings depending on the type.

- \texttt{(style)} is one character, which controls how the given data should be formatted. The list of allowed \texttt{(styles)} depends on the type.

The choice of \texttt{(alignment)} = is only valid for numeric types: in this case the padding is inserted between the sign and the rest of the number.

2 Formatting various data-types

\tl_format:Nn * \tl_format:nn \{\langle token list\rangle\} \{\langle format specification\rangle\}
\tl_format:cn * \tl_format:nn * Converts the \langle token list\rangle to a string according to the \langle format specification\rangle. The \langle style\rangle, if present, must be s. If \langle precision\rangle is given, all characters of the string representation of the \langle token list\rangle beyond the first \langle precision\rangle characters are discarded.
\seq_format:Nn * \seq_format:nn \{\langle sequence\rangle\} \{\langle format specification\rangle\}
\seq_format:cn * Converts each item in the \langle sequence\rangle to a string according to the \langle format specification\rangle, and concatenates the results.
\int_format:nn * \int_format:nn \{\langle intexpr\rangle\} \{\langle format specification\rangle\}
Evaluates the \langle integer expression\rangle and converts the result to a string according to the \langle format specification\rangle. The \langle style\rangle argument is not allowed. The \langle style\rangle can be b for binary output, d for decimal output (this is the default), o for octal output, X for hexadecimal output (using capital letters).
\fp_format:nn * \fp_format:nn \{\langle fprexpr\rangle\} \{\langle format specification\rangle\}
Evaluates the \langle floating point expression\rangle and converts the result to a string according to the \langle format specification\rangle. The \langle style\rangle can be
\begin{itemize}
\item e for scientific notation, with one digit before and \langle precision\rangle digits after the decimal separator, and an integer exponent, following e;
\item f for a fixed point notation, with \langle precision\rangle digits after the decimal separator and no exponent;
\item g for a general format, which uses style f for numbers in the range \([10^{-4}, 10^{\langle precision\rangle})\) and style e otherwise.
\end{itemize}
When there is no \langle style\rangle specifier nor \langle precision\rangle the number is displayed without rounding. Otherwise the \langle precision\rangle defaults to 6.

3 Possibilities, and things to do

\begin{itemize}
\item Provide a token list formatting \langle style\rangle which keeps the last \langle precision\rangle characters rather than the first \langle precision\rangle.
\end{itemize}

Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
