

\textbf{lipsum}

Access to 150 paragraphs of Lorem Ipsum dummy text$^{ab}$

Patrick Happel$^c$

July 28, 2021

Abstract

\textit{lipsum} is a \LaTeX{} package that produces dummy text to be used in test documents or examples. The paragraphs are taken with permission from \url{https://www.lipsum.com/}, thanks to James Wilson for this work. Furthermore, the following people contributed to \textit{lipsum} by suggesting improvements, correcting bugs or finding typos in the documentation: Florent Chervet, Ulrike Fischer, Vincent Belaïche, Enrico Gregorio, Frank Mittelbach, Karl Hagen. Please, file bug reports, typos in the documentation or feature requests as an issue on \url{https://github.com/PhelypeOleinik/lipsum/issues}.\footnote{Version: 2.5} \footnote{Since March 2021, Phelype Oleinik maintains this package (phelype.oleinik@latex-project.org).} \footnote{patrick.happel@rub.de}

1 Introduction

To load the package, write

\begin{verbatim}
\usepackage{lipsum}
\end{verbatim}

in the preamble of your document. Probably the most important macro provided by this package is \texttt{\textbackslash lipsum}, which typesets the \emph{Lorem ipsum} paragraphs. The first optional argument allows to specify the range of the paragraphs. For example, \texttt{\textbackslash lipsum[4-57]} typesets the paragraphs 4 to 57 and accordingly, \texttt{\textbackslash lipsum[23]} typesets the 23\textsuperscript{rd} paragraph. Using \texttt{\textbackslash lipsum} without its optional argument typesets the paragraphs 1–7 of \emph{Lorem ipsum}...

As of version 2.0, \texttt{\textbackslash lipsum} has a second optional argument which allows selecting a range of sentences from the paragraphs. To get the sentences four to eight from paragraphs three to nine, use \texttt{\textbackslash lipsum[3-9][4-8]}. The sentences are counted from the first sentence of the first selected paragraph. In the previous example, sentence number 1 is the first sentence of paragraph number 3.

1.1 Foreword to Version 2.4

Version 2.4 received another almost complete rewrite focusing on the internal structure of the package, and some minor fixes (see the \texttt{CHANGELOG} for more details).

The package now ships with a new dummy text, in pseudo-Czech, provided by Ondřej Macek. To select this text, load the package with \texttt{\usepackage[text=lipsum-cs]{lipsum}} or use \texttt{\setlipsum[text=lipsum-cs]}. The dummy texts now have a language metadata which is used to select the proper hyphenation patterns to the dummy text. For compatibility with old documents you can load \texttt{lipsum} with \texttt{\usepackage[auto-lang=false]{lipsum}} or, as above, use \texttt{\setlipsum[auto-lang=false]}. Finally, as demonstrated above, a new macro \texttt{\setlipsum} was added to change package options anywhere in the document, so you may change, for example, the dummy text printed by \texttt{\lipsum}
on-the-fly by using \setlipsum[text=\{name\}] (see section 4) for a list of available texts). In general, a key-val syntax was added which will eventually replace the command-based syntax for package settings. For the time being, both versions are available.

1.2 Foreword to Version 2.0

Version 2.0 of lipsum is a complete (well, nearly complete) rewrite of the code in expl3 syntax. I have never used expl3 before and thus the code might be too complicated, might use wrong or badly chosen data types or weird function names. I am happy to receive comments on this.

Due the complete rewrite, some internals have changed which might impact older documents. Since, however, I guess that lipsum is not used for documents with true, important, content, I think potentially breaking up old documents is not a big issue here. The changes are:

- The package option nopar now uses a \space as terminator, instead of \relax.
- The commands \UnpackLipsum and \UnpackLipsum* are no longer available. The effect of \UnpackLipsum now is default for \unpacklipsum (or \unpacklipsum*, depending on the package option). The effect of \UnpackLipsum* can be mimicked by using \LipsumProtect\{\{command\}\}, as in the following example:

  \documentclass{article}
  \usepackage{lipsum,xcolor}
  \newcommand\foo{}
  \SetLipsumParListItemEnd{\LipsumProtect{\foo}}

  \begin{document}
  \renewcommand\foo{\color{.!75!red}}
  \{ \lipsumexp }

  \newcounter{mycnt}\setcounter{mycnt}{1}
  \renewcommand\foo{\{\(\themycnt\)\stepcounter{mycnt}\{\}}}
  \lipsumexp

  \end{document}

- The internal macros \lips@i, \lips@ii, \lips@iii, ..., \lips@cl are no longer available.
- All other internal macros (with one exception) are no longer available, too.

1.3 Foreword to version 2.2

As of version 2.2, lipsum provides a simple interface to define other texts to be used as output of the \lipsum-family of commands. This was heavily inspired by an issue raised by svenper on github\(^1\). However, the implementation of this interface might not match the needs of everyone who wants to provide a dummy text in another language. Comments and suggestions on this are very welcome.

Please note that the documentation still only refers to the \textit{Lorem ipsum} text.

\(^1\)https://github.com/patta42/lipsum/issues/13
2 Usage

\lipsum was intended to quickly provide a way to fill a page or two to analyze the page layout. While it has grown in the meanwhile and now provides some more advanced features, it still is only intended to quickly provide text. If you want more features, look at the \blindtext-package.

2.1 Package Options

\lipsum outputs a range of paragraphs taken from the \textit{Lorem ipsum}... dummy text. The package options control mainly the behaviour of the \lipsum and \unpacklipsum commands, and can be set at load-time with \usepackage\{\textit{option}\}\{\lipsum\}, or later in the document by using \setlipsum\{\textit{option}\}.

- \texttt{nopar} = \langle boolean \rangle \hspace{1cm} (default: \texttt{false})
  Changes the initial default separator between each paragraph of \lipsum from \texttt{par} to \texttt{space}, and the other way around for \lipsum*.

- \texttt{text} = \langle name \rangle \hspace{1cm} (default: \texttt{lipsum})
  Selects the dummy text \langle name \rangle that is used by \lipsum and \unpacklipsum (see section 4).

- \texttt{language} = \langle lang \rangle \hspace{1cm} (default: \texttt{latin})
  Sets the language to be used by \lipsum to typeset the currently active dummy text (see section 3.2). Changing the dummy text with the text option will also change the current language.

- \texttt{auto-lang} = \langle boolean \rangle \hspace{1cm} (default: \texttt{true})
  Turns on/off automatic language switching. This changed since version 2.3, in which this option (didn’t exist thus) was \texttt{false} by default. See section 3.2 for more details.

- \texttt{default-range} = \langle p_i-p_f \rangle \hspace{1cm} (default: 1-7)
  Sets the default range of paragraphs produced by \lipsum when no optional argument is provided. The value to default-range obeys the \langle range \rangle syntax described in section 3.1. If no value is given to default-range (that is, \setlipsum\{default-range\}), then the default is reset to 1-7.

Besides these options, there are still ones that can be passed to the package to influence the paragraph and sentence separators and other such things. These options are detailed in section 3.3.

2.2 User Commands

\lipsum\langle par range\rangle\langle sentence range\rangle

\lipsum outputs the \langle par range\rangle from the currently active dummy text. If \langle par range\rangle is not given or is empty, the default-range (initially 1-7) is output. If a \langle sentence range\rangle is given, the selected paragraphs are split into sentences, numbered starting from 1, and the specified range of sentences is taken out from those paragraphs. If the \langle *\rangle version is used, a different set of separators is inserted around the paragraphs or sentences.

\lipsum changes the active language to that of the dummy text for typesetting, so the proper hyphenation patterns are used. See section 3.2. Section 3.1 explains the syntax of ranges, and section 3.3 explains the separators added around the pieces of text.

\footnote{https://groups.google.com/d/topic/de.comp.text.tex/oPeLOjkrIfk}
\unpacklipsum \lipsum exp selects the paragraphs and/or sentences exactly as described for \lipsum, but instead of outputting them, it saves the selected text in the \lipsumexp macro. Additionally, \unpacklipsum \lipsumexp is not completely equivalent to \lipsum because it doesn’t change languages as \lipsum does.

\setlipsum \setlipsum{\langle key-val list\rangle}
Applies the \langle key-val list\rangle of options to the package. The options are described in section 2.1 and in section 3.3.

2.3 Other commands
These commands exist for necessity or backwards compatibility, and should normally not be needed in user documents.

\SetLipsumDefault \SetLipsumDefault{\langle name\rangle}
 Loads the dummy text \langle name\rangle (see section 4). This command does the same as option text, but it is kept for backwards compatibility.

\SetLipsumText \SetLipsumText{\langle range\rangle}
Sets the default range for \lipsum and \unpacklipsum. This command does the same as option default-range, but it is kept for backwards compatibility.

3 General remarks on behaviour
Here are some topics that are general considerations about the behaviour of \lipsum and its commands. These are technicalities that most end users don’t care too much about, unless you are trying to do something beyond the usual “print me some dummy text”.

3.1 Syntax of paragraph and sentence ranges
A \langle range\rangle argument can either be blank, a single integer, or a proper integer range. If the \langle range\rangle argument is blank, the commands behave as if the argument was not given at all. For example, \lipsum[\[\]] behaves exactly like \lipsum and outputs the default paragraph range. Note that \lipsum[\[2-5\]] does not behave as \lipsum[2-5], but behaves as \lipsum[1-7][2-5] (assuming default=range=1-7), because the default value is then taken for the first argument. If the \langle range\rangle argument is an integer, then only a single paragraph/sentence is selected.

If the argument contains a - (ASCII 45), it is interpreted as a proper range \langle ni\rangle-\langle nf\rangle. In a proper range, if \langle ni\rangle is blank, it is taken to be the start of the possible range, and in the same way, if \langle nf\rangle is empty it is taken to be the end of the possible range. That is, \lipsum[-9] is the same as \lipsum[1-9], and \lipsum[5-] is the same (assuming the standard 150-paragraph dummy text) as \lipsum[5-150], and similarly, \lipsum[-] is the same as \lipsum[1-150].

Only one - is allowed in a range, so if more than one - is given, an error is raised and no paragraphs/sentences are output. No paragraphs or sentences will be output also in case one of the
ranges is reversed, so \lipsum[2-1] returns no paragraphs, as does \lipsum[2-1] output no sentences, for example. Note that “returning no paragraphs/sentences” is not “the output is empty”: that is mostly true, except that the -before and -after separators are still output (see section 3.3).

Finally, if a range spans more paragraphs or sentences than what the dummy text actually provides, the range is truncated so that it fits the available text. If the range in the argument does not intersect with the range provided by the dummy text, no paragraphs or sentences are output.

3.2 Hyphenation patterns

Since version 2.4, the command \lipsum automatically changes the hyphenation patterns when typesetting a dummy text, so that line-breaking looks better (see section 1.1). This feature is on by default, so if you need the old behaviour you have to explicitly disable automatic language switching with \setlipsum{auto-lang=false}.

\lipsum relies on babel’s \hyphenrules command to change the hyphenation patterns, thus it requires babel to be loaded in the document if auto-lang=true. If babel is not loaded, a warning is printed and the default language is used for hyphenation instead.

The language is defined individually for each dummy text (see section 4), but you may change it for the current dummy text by using \setlipsum{language=(lang)}. If you load another dummy text (for example with the text option), then the option language is also changed according to the dummy text loaded (see section 4).

3.3 Paragraph and sentence separators

As may be clear by now, \lipsum has two modes of operation: sentence output, and paragraph output, selected by providing or not providing the second optional argument to \lipsum. In each mode, the dummy text is separated into chunks (paragraphs or sentences), which are counted, and then output accordingly.

When \lipsum (or \unpacklipsum) is used with a single (or no) optional argument, then a range of paragraphs is output, along with some “separators” (in the lack of a better name) between paragraphs, around each paragraph, and before and after the whole output. A schematic (very colorful, because I couldn’t find a better visual) representation of the output is:

When \lipsum is called, the first thing it outputs is the par-before tokens. These tokens are output unconditionally, regardless of how many (if any) paragraph is output.

Then, before each paragraph in the range, \lipsum outputs the par-begin tokens, and then the actual text of the (paragraph), and then the par-end tokens. These tokens are output conditionally, if the paragraph text is output. If more than one paragraph is output, then the par-sep tokens are inserted between the par-end of one paragraph and the par-begin of the paragraph that follows.
Finally, at the end, the par-after tokens are inserted unconditionally at the end, same as for par-before.

As mentioned before, in case of an error parsing the range, the output will be no paragraphs, but the par-before and par-after tokens are still output.

The explanation above is equally valid for the starred variants. If \texttt{\textbackslash{lipsum}*} is used, the par-before* tokens are inserted, and so on.

It is also true for sentences (starred or otherwise), replacing \texttt{par} in the option names by \texttt{sentence}, so when you use, for example, \texttt{\textbackslash{lipsum}[1-9]}, the sentence-before tokens will be unconditionally inserted, and so on.

Note that, when \texttt{\textbackslash{lipsum}} is used in sentence-mode (for example, with \texttt{\textbackslash{lipsum}[1-3][1-9]}), only the sentence-... tokens are inserted in the output, regardless of how many paragraphs those sentences were collected from. In the same way, if paragraph-mode is being used, only par-... tokens are inserted.

### 3.3.1 Deprecated command-based syntax

Older versions of \texttt{lipsum} (from 2.0 to 2.3) provided 10 CamelCase commands for changing the separators, but the syntax was rather cumbersome to use, so the keyval syntax presented thus far was introduced in the hopes of making things a bit easier. The old commands will still exist for some time in the package, but with a deprecation warning. Changing to the keyval syntax is advised, so here is a correspondence table between the old and new syntaxes:

<table>
<thead>
<tr>
<th>Old command</th>
<th>New key name</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListStart}}</td>
<td>par-before</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListStart}}</td>
<td>par-begin</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListItemStart}}</td>
<td>par-sep</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListItemEnd}}</td>
<td>par-end</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListStart}}</td>
<td>sentence-before</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListItemStart}}</td>
<td>sentence-begin</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListItemSeparator}}</td>
<td>sentence-sep</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListEnd}}</td>
<td>sentence-after</td>
</tr>
</tbody>
</table>

Additionally, the command-based interface provided shortcuts \texttt{\textbackslash{SetLipsum\{\langle Thing\rangle\}\List\{\Item\}\Surrounders}}, which are equivalent to just using the commands \texttt{\textbackslash{SetLipsum\{\langle Thing\rangle\}\List\{\Item\}\Start}} then \texttt{\textbackslash{\End}}. These don’t provide any functionality, other than requiring a little less typing, so no key-val alternative was implemented. The \texttt{\textbackslash{\langle Thing\rangle\...\Surrounders}} commands should be replaced by \texttt{(\langle thing\rangle)-before} and \texttt{(\langle thing\rangle)-after}, and the \texttt{\langle Thing\rangle\...\ItemSurrounders} commands should be replaced by \texttt{\langle thing\rangle}-begin and \texttt{\langle thing\rangle}-end, as in the correspondence table below:

<table>
<thead>
<tr>
<th>Old command</th>
<th>New key names</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListSurrounders}}</td>
<td>par-before</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumParListItemSurrounders}}</td>
<td>par-after</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListSurrounders}}</td>
<td>sentence-before</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListItemSurrounders}}</td>
<td>sentence-begin</td>
</tr>
<tr>
<td>\texttt{\textbackslash{SetLipsumSentenceListItemSurrounders}}</td>
<td>sentence-after</td>
</tr>
</tbody>
</table>
4 Loading and defining dummy texts

Starting with \lipsum v2.2, a simple interface is provided to define and load other texts for the output of \lipsum and friends. This interface can, for example, be used to implement dummy texts in different languages without re-coding the logic implemented by \lipsum.

\NewLipsumPar{\langle \text{paragraph} \rangle}

In order to provide a new text that will be used by \lipsum, define the text by using a set of \NewLipsumPar{\langle \text{paragraph} \rangle} commands in a file with the ending \texttt{.ltd.tex} (\texttt{ltd} means \textit{lipsum text definition}) to a location where your \TeX system will find it. The \texttt{\langle \text{paragraph} \rangle}-argument is a single paragraph of the new text. Thus, the first occurrence of \NewLipsumPar defines the first paragraph, the second occurrence the second paragraph and so on.

\SetLipsumLanguage{\langle \text{lang} \rangle}

Additionally, tell \lipsum the language of the dummy text using \SetLipsumLanguage{\langle \text{lang} \rangle} somewhere in the \texttt{.ltd.tex} file.

To specify the new text as output for \lipsum and friends, use \texttt{\setlipsum{\langle \text{name} \rangle}}, where \langle \text{name} \rangle is the name of the file without the ending \texttt{.ltd.tex}, as given in the table below. When a new dummy text is loaded, the previous one is cleared, and the language is changed as well, according to the table.

<table>
<thead>
<tr>
<th>File (.ltd.tex)</th>
<th>Language</th>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lipsum</td>
<td>Latin</td>
<td>James Wilson</td>
<td>Contains the standard \textit{Lorem ipsum} dummy text, obtained from <a href="https://www.lipsum.com">https://www.lipsum.com</a> (default).</td>
</tr>
<tr>
<td>cicero</td>
<td>Latin</td>
<td>GH user svenper</td>
<td>Contains the speech by Cicero which inspired the \textit{Lorem ipsum}... dummy text.</td>
</tr>
</tbody>
</table>

4.1 Guidelines on providing new dummy texts

\SetLipsumText more or less just uses an \texttt{\input} or, to be more precise, the \TeX3-variant \texttt{\file_input:n}, to load the \texttt{.ltd.tex} file. This means, that the file is not necessarily loaded in the preamble of the document and thus the contents of the file underlie the respective restrictions.

Should you want a new dummy text, create an issue in the GitHub repository\(^4\) with the source for the dummy text.

Should you prefer to distribute the dummy text as a separate package, make sure that the text follows the layout of \lipsum’s dummy texts, so that everything works correctly. The dummy text definition file should contain a line with \SetLipsumLanguage, and then as many \NewLipsumPar entries as there are paragraphs in the dummy text. Make sure that the file has the \texttt{.ltd.tex} extension, and everything should work smoothly.

\(^3\)To avoid name clashes with files using general languages as names, I chose to introduce the \texttt{.ltd.tex} file ending. I did not find a file with this ending in my \texttt{texmf}-tree, so I guess it is safe.

\(^4\)https://github.com/PhelypeOleinik/lipsum
5 **lipsum Implementation**

5.1 Variables

\g\_lipsum\_par\_int Stores the number of paragraphs in the current text.
\[ \text{\int\_new:N} \ \text{\g\_lipsum\_par\_int} \]
(End definition for \g\_lipsum\_par\_int.)

\g\_lipsum\_language\_tl Stores the language of the dummy text for hyphenation patterns.
\[ \text{\tl\_new:N} \ \text{\g\_lipsum\_language\_tl} \]
(End definition for \g\_lipsum\_language\_tl.)

\g\_lipsum\_default\_range\_tl The default range for lipsum paragraphs.
\[ \text{\tl\_new:N} \ \text{\g\_lipsum\_default\_range\_tl} \]
(End definition for \g\_lipsum\_default\_range\_tl.)

\l\_lipsum\_output\_tl This variables is used to store the token list containing the selected output.
\[ \text{\tl\_new:N} \ \text{\l\_lipsum\_output\_tl} \]
(End definition for \l\_lipsum\_output\_tl.)

\g\_lipsum\_text\_str Holds the current text loaded for the output of \lipsum and friends. Used to avoid loading the same text definition if it is already used.
\[ \text{\str\_new:N} \ \text{\g\_lipsum\_text\_str} \]
(End definition for \g\_lipsum\_text\_str.)

\l\_lipsum\_sep\_set\_str Holds the name of the active separator token set. By default it is empty to use the default separator set (empty).
\[ \text{\str\_new:N} \ \text{\l\_lipsum\_sep\_set\_str} \]
(End definition for \l\_lipsum\_sep\_set\_str.)

\l\_lipsum\_autolang\_bool Boolean whether to change hyphenation patterns according to the dummy text language.
\[ \text{\bool\_new:N} \ \text{\l\_lipsum\_autolang\_bool} \]
(End definition for \l\_lipsum\_autolang\_bool.)

\q\_lipsum\_mark \s\_lipsum Quark and scan mark used throughout the package.
\[ \text{\quark\_new:N} \ \text{\q\_lipsum\_mark} \]
\[ \text{\scan\_new:N} \ \text{\s\_lipsum} \]
(End definition for \q\_lipsum\_mark and \s\_lipsum.)

\l\_lipsum\_tmpa\_str \l\_lipsum\_a\_int \l\_lipsum\_b\_int Scratch variables.
\[ \text{\str\_new:N} \ \text{\l\_lipsum\_tmpa\_str} \]
\[ \text{\int\_new:N} \ \text{\l\_lipsum\_a\_int} \]
\[ \text{\int\_new:N} \ \text{\l\_lipsum\_b\_int} \]
(End definition for \l\_lipsum\_tmpa\_str, \l\_lipsum\_a\_int, and \l\_lipsum\_b\_int.)
Scratch macro.

\cs_new_eq:NN \__lipsum_tmp:w ?

(End definition for \__lipsum_tmp:w.)

These variables store the separators and delimiters added around the paragraphs and sentences, in the starred or nonstarred variants, as well as the generic version for runtime usage.

\clist_map_inline:nn { start, itemstart, itemseparator, itemend, end }
\clist_map_inline:nn { par, sentence }
\clist_map_inline:nn { \{ }, star, nostar }
\tl_new:c { l__lipsum_par_#1_parsepar_tl }
\tl_new:c { l__lipsum_par_itemseparator_parsepar_tl }
\tl_set:Nn \l__lipsum_par_itemseparator_parsepar_tl { ~ }

(End definition for \l__lipsum_<thing>_<place>_<version>_tl.)

5.2 Developer interface

Parses an argument that may be a single integer or an integer range separated by a \-, and stores them into the integer registers \#2 and \#3. If a number is blank, zero is used. If only a single number is given, \#3 is set equal to \#2.

\cs_new_protected:Npn \__lipsum_parse_par_range:nNN \__lipsum_parse_par_range:eNN \__lipsum_parse_sentence_range:nNN \__lipsum_parse_sentence_range:eNN \__lipsum_parse_range_arg:nNNn \__lipsum_parse_range_arg:wnNNn \__lipsum_int_set:Nnn

(End definition for \lipsum_get_range:nn and others.)
5.3 User- and developer-level commands

\LipsumPar

Macro to typeset a single paragraph of *Lorem ipsum*... Was not officially available in version prior to 2.0.

- \#1: Number of the paragraph to typeset.
- Implemented as follows:

\begin{verbatim}
\NewDocumentCommand \LipsumPar { m } {
\__lipsum_deprecated:n { LipsumPar }
\__lipsum_unexpanded_par:n {#1} \par }
\end{verbatim}

(End definition for \LipsumPar.)

5.4 Tokens surrounding the *Lorem ipsum*... content

\__lipsum_element_set:nnn

A general macro for setting starred/non-starred versions of several elements used between chunks of dummy text. Arguments are:

- \#1: Element name;
- \#2: Boolean true or false if the * variant was used;
- \#3: Value to set the element to.

\begin{verbatim}
\cs_new_protected:Npn \__lipsum_element_set:nnn #1 #2 #3 {
\tl_set:cn { l__lipsum_#1\IfBooleanF{#2}{no}star_tl } {#3} }
\end{verbatim}

(End definition for \__lipsum_element_set:nnn.)

\__lipsum_deprecated:n

Warns about deprecated commands and destroys itself.

\begin{verbatim}
\cs_new_protected:Npn \__lipsum_deprecated:n #1 {
\msg_warning:nnn { lipsum } { cmd-deprecated } {#1}
\cs_gset_eq:NN \__lipsum_deprecated:n \use_none:n }
\end{verbatim}

(End definition for \__lipsum_deprecated:n.)

A dirty loop to quickly define the old command-based user-interface.

\begin{verbatim}
\cs_set_protected:Npn \__lipsum_tmp:w #1 #2 #3 #4 {
\str_set:Nx \l__lipsum_tmpa_str
{ #2 \tl_if_empty:nTF {#4} {#3} { start } }
\use:e
{ 
\NewDocumentCommand \exp_not:c { SetLipsum #1 List #2 #3 }
{ s +m \tl_if_empty:nF {#4} { +m } }
\end{verbatim}
\SetLipsumDefault \lipsum

\SetLipsumDefault Command to change the default range used by \lipsum and friends.

\lipsum \lipsum* \unpacklipsum The following macros are considered to be user-level commands and thus all lower-case.

\lipsum #1: Range-like string that specifies the number of the paragraphs taken from Lorem ipsum... If omitted, the value set by \SetLipsumDefault is used, which defaults to 1-7.

\lipsum #2: Sentences to be typeset from the range selected by (paragraph range). If sentences outside the number of sentences in (paragraph range) are specified, only existing sentences are typeset.

The difference between \lipsum and \lipsum* is the token(s) that are inserted after each paragraph (only if called without the second optional argument).

\lipsum and \unpacklipsum have the same interface and do almost the same thing, so both are implemented using a common macro \_\lipsum_do:nnnn that does the heavy-lifting, and at the end executes the code in #4.
\unpacklipsum\lipsumexp

This command does the same as \lipsum, but instead of typesetting the paragraphs or sentences, it stores the expanded content in the \lipsumexp token list. The tokens between items of the list, set, for example, by using the package option space or by using the \SetLipsum...List commands, are \textit{x}-expanded.

\NewDocumentCommand \unpacklipsum { s O { \g_lipsum_default_range_tl } o } { \__lipsum_do:nnnn {#1} {#2} {#3} { \tl_gset_eq:NN \lipsumexp ##1 } }

\cs_new_eq:NN \lipsumexp \prg_do_nothing:

\__lipsum_do:nnnn\__lipsum_do:N

This is the main macro for \lipsum and \unpacklipsum. It parses the paragraph range, sets the sentence/paragraph separators, then acts accordingly if a sentence range was provided.

\cs_new_protected:Npn \__lipsum_do:nnnn #1 #2 #3 #4

\__lipsum_do:N \l__lipsum_output_tl
\cs_new_eq:NN \__lipsum_do:N ?

\__lipsum_set_hyphens:\__lipsum_restore_hyphens:

Selects the hyphenation patterns for the language of the dummy text, using babel's \texttt{hyphenrules} if that’s defined. If \texttt{hyphenrules} doesn’t exist (thus babel not loaded), call \texttt{\__lipsum_set_hyphens_babel_missing} which will behave in a slightly different way if encountered in the preamble or in the document body. The hyphenation patterns are properly restored by \texttt{\__lipsum_restore_hyphens}: when the text ends.
\cs_new_protected:Npn \__lipsum_set_hyphens:
{ \use:n \use_none:n }
{ \cs_if_exist:NTF \hyphenrules
  { \cs_if_exist:cTF { l@ \g__lipsum_language_tl }
    { \exp_args:NV \hyphenrules \g__lipsum_language_tl
      \cs_set_protected:Npx \__lipsum_restore_hyphens:
      { \exp_not:N \hyphenrules { \languagename } }
    }
    \__lipsum_missing_language_warning: }
  }
{ \__lipsum_set_hyphens_babel_missing: }
}
\cs_new_protected:Npn \__lipsum_restore_hyphens:
{ \prg_do_nothing: }

(End definition for \__lipsum_set_hyphens: and \__lipsum_restore_hyphens:.)

\__lipsum_set_hyphens_babel_missing: In the document preamble this emits a warning telling the user that the proper hyphenations can't be used because \texttt{babel} isn't loaded, then shut up for the rest of the preamble. In the document body however, this is more serious, so we give a final warning and deactivate automatic hyphenation setting.

\cs_new_protected:Npn \__lipsum_set_hyphens_babel_missing:
{ \msg_warning:nnn { lipsum } { missing-babel } { preamble }
  \cs_gset_eq:NN \__lipsum_set_hyphens_babel_missing: \prg_do_nothing: }
\AtBeginDocument
{ \cs_gset_protected:Npx \__lipsum_set_hyphens_babel_missing:
  \prg_do_nothing: }

(End definition for \__lipsum_set_hyphens_babel_missing:.)

\__lipsum_missing_language_warning: Warn the user about an unknown/missing language. Most of the time the issue is a minimal installation that doesn’t have Latin, but sometimes it may be a typo. Regardless of the case, warn the user then change the language to \texttt{\languagename} so the warning appears only once, at least until it is changed again.

\cs_new_protected:Npn \__lipsum_missing_language_warning:
{ }

15
\msg_warning:nn { \lipsum } { missing-language }
\tl_gset_eq:NN \g__lipsum_language_tl \language\name }
(End definition for \___lipsum_missing_language_warning:)
\NewLipsumPar
Developer-Level macro to add a paragraph to the dummy text used by \lipsum and related
commands. To specify a new dummy text, see section 4.
\cs_new_protected:Npn \NewLipsumPar #1
\{ \int_gincr:N \g__lipsum_par_int
\tl_gclear_new:c { \g__lipsum_par_ \int_use:N \g__lipsum_par_int _tl }
\tl_gset:cn { \g__lipsum_par_ \int_use:N \g__lipsum_par_int _tl } {#1}
\}
(End definition for \NewLipsumPar. This function is documented on page 7.)
\SetLipsumText
Used to select and load the text output by \lipsum and friends. See the section on loading
and defining new outputs for \lipsum (section 4). It first checks whether the requested text
is already loaded, and if not, it loads the corresponding lipsum text definition file, and clears
remaining paragraphs from the previous text, in case their lengths differ.
\NewDocumentCommand \SetLipsumText { m }
\{ \str_if_eq:VnF \g__lipsum_text_str {#1}
\{ \tl_gset:Nn \g__lipsum_language_tl \english
\int_gzero:N \g__lipsum_par_int
\file_input:n { #1.ltd }
\str_gset:Nn \g__lipsum_text_str {#1}
\}
\}
(End definition for \SetLipsumText. This function is documented on page 4.)
\SetLipsumLanguage
This macro sets the language for hyphenation patterns of the dummy text. When a new
lipsum text is read, this is reset.
\NewDocumentCommand \SetLipsumLanguage { m }
\{ \tl_gset:Nn \g__lipsum_language_tl \english
\}
(End definition for \SetLipsumLanguage. This function is documented on page 7.)

5.5 Package options and defaults
These are some auxiliaries for the package options and for setting up the default behaviour.
\cs_new_protected:Npn \\___lipsum_delim_restore:nnn \#1 \#2 \#3
\{ \keys_set:nn \{ \lipsum \}
\{ #1-before = , #1-begin = , #1-end = , #1-after = ,
#1-before* = , #1-begin* = , #1-end* = , #1-after* = ,
#1-sep = {#2}, #1-sep* = {#3}
\}
\}
\cs_new_protected:Nn \\___lipsum_restore_par_list:
\cs_new_protected:Nn \\___lipsum_restore_sentence_list:
\setlipsum

Here are the options available at load-time and to \setlipsum.

\NewDocumentCommand \setlipsum { +m } {{\keys_set:nn { lipsum } {#1} }}
\keys_define:nn { lipsum } {
  nopar .choice: ,
  nopar / true .code:n =
    \cs_gset_protected:Npn \__lipsum_restore_par_list: { \__lipsum_delim_restore:nnn { par } { ~ } { \par } },
  nopar / false .code:n =
    \cs_gset_protected:Nn \__lipsum_restore_par_list: { \__lipsum_delim_restore:nnn { par } { \par } { ~ } },
  nopar .initial:n = false ,
  nopar .default:n = true ,

auto-lang sets \l__lipsum_autolang_bool. It is initially true, changing the default
behaviour from previous versions.

auto-lang .bool_set:N = \l__lipsum_autolang_bool ,
auto-lang .initial:n = true ,
auto-lang .default:n = true ,
text just does \SetLipsumText. The initial value is not set here because this chunk of code
is executed in expl3 syntax, then the text loads without spaces, so \setlipsum{text=lipsum}
is used later.

text .code:n = \SetLipsumText(#1) ,
text .value_required:n = true ,

(End definition for \LipsumRestoreParList and others.)
language sets the language to be used when typesetting.

\language .tl_gset:N = \g__lipsum_language_tl ,
\language .value_required:n = true ,
default-range does \SetLipsumDefault, initially 1-7, as documented. It’s default is also 1-7 so that the key has two meanings: \setlipsum{default-range=⟨range⟩} sets the range to the given value, while \setlipsum{default-range} sets the range to the “default default range”. Pretty neat :)

\default-range .code:n = \SetLipsumDefault{#1} ,
\default-range .initial:n = 1-7 ,
\default-range .default:n = 1-7 ,
}

This chunk defines the keys ⟨thing⟩-⟨place⟩[*], where ⟨thing⟩ is par or sentence, ⟨place⟩ is before, begin, sep, end, and after, which totals 10 keys, and another 10 with the * in the name. Each sets a token list called \l__lipsum⟨thing⟩⟨place⟩[no]star_tl.

\cs_set_protected:Npn \__lipsum_tmp:w #1 #2 #3
{\keys_define:nn { lipsum }
{ #1-before #2 .tl_set:c = \l__lipsum#1_start #3star_tl ,
#1-begin #2 .tl_set:c = \l__lipsum#1_itemstart #3star_tl ,
#1-sep #2 .tl_set:c = \l__lipsum#1_itemseparator #3star_tl ,
#1-end #2 .tl_set:c = \l__lipsum#1_itemend #3star_tl ,
#1-after #2 .tl_set:c = \l__lipsum#1_end #3star_tl ,
}
\__lipsum_tmp:w { par } { } { no } \__lipsum_tmp:w { sentence } { } { no }
\__lipsum_tmp:w { par } * { } \__lipsum_tmp:w { sentence } * { }

(End definition for \setlipsum. This function is documented on page 4.)

Now turn \ExplSyntaxOff for a while, and load the default Lorem ipsum... text, then process the package options, and finally turn \ExplSyntaxOn again. Finally, call \__lipsum_restore_par_list: and \__lipsum_restore_sentence_list: to set the de-
defaults (\__lipsum_restore_par_list: may have been redefined by nopar).

\ExplSyntaxOff
\setlipsum{text=lipsum}
\ProcessKeysOptions{lipsum}
\ExplSyntaxOn
\__lipsum_restore_par_list:
\__lipsum_restore_sentence_list:
