Abstract

This package defines the \texttt{longtable} environment, a multi-page version of \texttt{tabular}.

List of Tables

\begin{tabular}{ll}
1 & An optional table caption (used in the list of tables) \\
2 & A floating table \\
3 & A difficult \texttt{\textbackslash multicol}um\n\textbackslash combination: pass 1 \\
4 & A difficult \texttt{\textbackslash multicol}um\n\textbackslash combination: pass 2 \\
5 & A difficult \texttt{\textbackslash multicol}um\n\textbackslash combination: pass 3 \\
6 & A difficult \texttt{\textbackslash multicol}um\n\textbackslash combination: pass 4 \\
7 & A summary of \texttt{longtable} commands
\end{tabular}

1 Introduction

\texttt{longtable} The \texttt{longtable} package defines a new environment, \texttt{longtable}, which has most of the features of the \texttt{tabular} environment, but produces tables which may be broken by \TeX{}’s standard page-breaking algorithm. It also shares some features with the \texttt{table} environment. In particular it uses the same counter, \texttt{table}, and has a similar \texttt{\textbackslash caption} command. Also, the standard \texttt{\textbackslash listoftables} command lists tables produced by either the \texttt{table} or \texttt{longtable} environments.

The following example uses most of the features of the \texttt{longtable} environment. An edited listing of the input for this example appears in Section 8.

\textbf{Note:} Various parts of the following table will not line up correctly until this document has been run through \TeX{} several times. This is a characteristic feature of this package, as described below.

2 Chunk Size

\texttt{\textbackslash LTchunksize} In order to \TeX multi-page tables, it is necessary to break up the table into smaller chunks, so that \TeX does not have to keep everything in memory at one time. By default \texttt{\textbackslash longtable} uses 20 rows per chunk, but this can be set by the user, with e.g., \texttt{\textbackslash setcounter{\texttt{\textbackslash LTchunksize}}{10}}.\footnote{This is a footnote.} These chunks do not affect page breaking, thus if you are using a \TeX with a lot of memory, you can set \texttt{\textbackslash LTchunksize} to be several pages of the table. \TeX will run faster with a large \texttt{\textbackslash LTchunksize}.

\footnote{\texttt{\textbackslash LTchunksize} takes special precautions, so that footnotes may also be used in ‘p’ columns.}

\footnote{You can also use the plain \TeX syntax \texttt{\textbackslash LTchunksize}=10.}
However, if necessary, \textit{longtable} can work with \texttt{LTchunksize} set to 1, in which case the memory taken up is negligible. Note that if you use the commands for setting the table head or foot (see below), the \texttt{LTchunksize} must be at least as large as the number of rows in each of the head or foot sections.

This document specifies \texttt{\setcounter{LTchunksize}{200}}. If you look at the previous table, after the first run of \LaTeX{} you will see that various parts of the table do not line up. \LaTeX{} will also have printed a warning that the column widths had changed. \textit{longtable} writes information onto the \texttt{.aux} file, so that it can line up the different chunks. Prior to version 4 of this package, this information was not used unless a \texttt{\setlongtables} command was issued, however, now the information is always used, using a new algorithm\footnote{Due to David Kastrup.} and so \texttt{\setlongtables} is no longer needed. It is defined (but does nothing) for the benefit of old documents that use it.

### 3 Captions and Headings

At the start of the table one may specify lines which are to appear at the top of every page (under the headline, but before the other lines of the table). The lines are entered as normal, but the last \texttt{\}\ command is replaced by a \texttt{\endhead} command. If the first page should have a different heading, then this should be entered in the same way, and terminated with the \texttt{\endfirsthead} command. The \texttt{LTchunksize} should be at least as large as the number of rows in the heading.

There are also \texttt{\endfoot} and \texttt{\endlastfoot} commands which are used in the same way (at the start of the table) to specify rows (or an \texttt{\hline}) to appear at the bottom of each page. In certain situations, you may want to place lines which logically belong in the table body at the end of the \texttt{\firsthead}, or the beginning of the \texttt{\lastfoot}. This helps to control which lines appear on the first and last page of the table.

The \texttt{\caption{...}} command is essentially equivalent to \texttt{\multicolumn{n}{c}{\parbox{\LTcapwidth}{...}}} where \texttt{n} is the number of columns of the table. You may set the width of the caption with a command such as \texttt{\setlength{\LTcapwidth}{2in}} in the preamble of your document. The default is 4in. \texttt{\caption} also writes the information to produce an entry in the list of tables. As with the \texttt{\caption} command in the \texttt{figure} and \texttt{table} environments, an optional argument specifies the text to appear in the list of tables if this is different from the text to appear in the caption. Thus the caption for table 1 was specified as \texttt{\caption[An optional table caption (used in the list of tables)]{A long table\label{long}}}.

You may wish the caption on later pages to be different to that on the first page. In this case put the \texttt{\caption} command in the first heading, and put a subsidiary caption in a \texttt{\caption} command in the main heading. If the optional argument to \texttt{\caption} is empty, no entry is made in the list of tables. Alternatively, if
you do not want the table number to be printed each time, use the \caption* command.

The captions are set based on the code for the article class. If you have re-defined the standard \@makecaption command to produce a different format for the captions, you may need to make similar changes to the longtable version, \LT@makecaption. See the code section for more details.

A more convenient method of customising captions is given by the caption(2) package, which provides commands for customising captions, and arranges that the captions in standard environments, and many environments provided by packages (including longtable) are modified in a compatible manner.

You may use the \label command so that you can cross reference longtables with \ref. Note however, that the \label command should not be used in a heading that may appear more than once. Place it either in the firsthead, or in the body of the table. It should not be the first command in any entry.

4 Multicolumn entries

The \multicolumn command may be used in longtable in exactly the same way as for tabular. So you may want to skip this section, which is rather technical, however coping with \multicolumn is one of the main problems for an environment such as longtable. The main effect that a user will see is that certain combinations of \multicolumn entries will result in a document needing more runs of \LaTeX before the various ‘chunks’ of a table align.

The examples in this section are set with LTchunksize set to the minimum value of one, to demonstrate the effects when \multicolumn entries occur in different chunks.

Consider Table 3. In the second chunk, longtable sees the wide multicolumn entry. At this point it thinks that the first two columns are very narrow. All the width of the multicolumn entry is assumed to be in the third column. (This is a ‘feature’ of \TeX’s primitive \halign command.) longtable then passes the information that there is a wide column to the later chunks, with the result that the first pass over the table is too wide.

If the ‘saved row’ from this first pass was re-inserted into the table on the next pass, the table would line up in two passes, but would be much too wide.

The solution to this problem used in Versions 1 and 2, was to use a \kill line. If a line is \killed, by using \kill rather than \ at the end of the line, it is used in calculating column widths, but removed from the final table. Thus entering \killed copies of the last two rows before the wide multicolumn entry would mean that \halign ‘saw’ the wide entries in the first two columns, and so would not widen the third column by so much to make room for the multicolumn entry.

In Version 3, a new solution was introduced. If the saved row in the .aux file was not being used, longtable used a special ‘draft’ form of \multicolumn, this modified the definition, so the spanning entry was never considered to be wider than the columns it spanned. So after the first pass, the .aux file stored the widest normal entry for each column, no column was widened due to \spanned columns. By default longtable ignored the .aux file, and so each run of \LaTeX was considered a first pass. Once the \setlongtables declaration was given, the saved row in the .aux file, and the proper definition of \multicolumn were

........................................ longtable.sty ........................................

<tr>
<td>wide 1</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>
used. If any `\multicolumn` entry caused one of the columns to be widened, this information could not be passed back to earlier chunks, and so the table would not correctly line up until the third pass. This algorithm always converged in three passes as described above, but in examples such as the ones in Tables 3–6, the final widths were not optimal as the width of column 2, which is determined by a `\multicolumn` entry was not known when the final width for column 3 was fixed, due to the fact that both `\multicolumn` commands were switched from ‘draft’ mode to ‘normal’ mode at the same time.

Version 4 alleviates the problem considerably. The first pass of the table will indeed have the third column much too wide. However, on the next pass `longtable` will notice the error and reduce the column width accordingly. If this has to propagate to chunks before the `\multicolumn` one, an additional pass will, of course, be needed. It is possible to construct tables where this rippling up of the correct widths takes several passes to ‘converge’ and produce a table with all chunks aligned. However in order to need many passes one needs to construct a table with many overlapping `\multicolumn` entries, all being wider than the natural widths of the columns they span, and all occurring in different chunks. In the typical case the algorithm will converge after three or four passes, and, the benefits of not needing to edit the document before the final run to add `\setlongtables`, and the better choice of final column widths in the case of multiple `\multicolumn` entries will hopefully more than pay for the extra passes that may possibly be needed.

So Table 3 converges after 4 passes, as seen in Table 6.

You can still speed the convergence by introducing judicious `\kill` lines, if you happen to have constellations like the above.

If you object even to `\LaTeX`-ing a file twice, you should make the first line of every `longtable` a `\kill` line that contains the widest entry to be used in each column. All chunks will then line up on the first pass.

5 Adjustment

The optional argument of `longtable` controls the horizontal alignment of the table. The possible options are `[c]`, `[r]` and `[l]`, for centring, right and left adjustment, respectively. Normally centring is the default, but this document specifies

```latex
\setlength\LTleft{\parindent}
\setlength\LTright{\fill}
```

in the preamble, which means that the tables are set flush left, but indented by the usual paragraph indentation. Any lengths can be specified for these two parameters, but at least one of them should be a rubber length so that it fills up the width of the page, unless rubber lengths are added between the columns using the `\extracolsep` command. For instance

```
\begin{tabular}{c}\{\textwidth}\{@\{\extracolsep{...}\}\}
```

produces a full width table, to get a similar effect with `longtable` specify

```latex
\setlength\LTleft{0pt}
\setlength\LTright{0pt}
\begin{longtable}{c@{\extracolsep{...}}}...
```
6 Changes

This section highlights the major changes since version 2. A more detailed change log may be produced at the end of the code listing if the \texttt{ltxdoc.cfg} file specifies

\texttt{\AtBeginDocument{\RecordChanges}}
\texttt{\AtEndDocument{\PrintChanges}}

Changes made between versions 2 and 3.

- The mechanism for adding the head and foot of the table has been completely rewritten. With this new mechanism, \texttt{longtable} does not need to issue a \texttt{\clearpage} at the start of the table, and so the table may start half way down a page. Also the \texttt{\endlastfoot} command which could not safely be implemented under the old scheme, has been added.

- \texttt{longtable} now issues an error if started in the scope of \texttt{\twocolumn}, or the \texttt{multicols} environment.

- The separate documentation file \texttt{longtable.tex} has been merged with the package file, \texttt{longtable.dtx} using Mittelbach's \texttt{doc} package.

- Support for footnotes has been added. Note however that \texttt{\footnote} will not work in the ’head’ or ’foot’ sections of the table. In order to put a footnote in those sections (e.g., inside a caption), use \texttt{\footnotemark} at that point, and \texttt{\footnotetext} anywhere in the table body that will fall on the same page.

- The treatment of \texttt{\multicolumn} has changed, making \texttt{\kill} lines unnecessary, at the price of sometimes requiring a third pass through \LaTeX.

- The \texttt{\newpage} command now works inside a \texttt{longtable}.

Changes made between versions 3 and 4.

- A new algorithm is used for aligning chunks. As well as the widest width in each column, \texttt{longtable} remembers which chunk produced this maximum. This allows it to check that the maximum is still achieved in later runs. As \texttt{longtable} can now deal with columns shrinking as the file is edited, the \texttt{\setlongtables} system is no longer needed and is disabled.

- An extra benefit of the new algorithm’s ability to deal with ‘shrinking’ columns is that it can give better (narrower) column widths in the case of overlapping \texttt{\multicolumn} entries in different chunks than the previous algorithm produced.

- The ‘draft’ \texttt{multicolumn} system has been removed, along with related commands such as \texttt{\LTmulticolumn}.

- The disadvantage of the new algorithm is that it can take more passes. The theoretical maximum is approximately twice the length of a ‘chain’ of columns with overlapping \texttt{\multicolumn} entries, although in practice it usually converges as fast as the old version. (Which always converged in three passes once \texttt{\setlongtables} was activated.)

- \texttt{\*} and \texttt{\nopagebreak} commands may be used to control page breaking.
7 Summary

Table 7: A summary of \texttt{longtable} commands

\begin{tabular}{ll}
\textbf{Parameters} \\
\texttt{\LTleft} & Glue to the left of the table. \\
\texttt{\LTright} & Glue to the right of the table. \\
\texttt{\LTpre} & Glue before the table. \\
\texttt{\LTpost} & Glue after the table. \\
\texttt{\LTcapwidth} & The width of a parbox containing the caption. \\
\texttt{\LTchunksize} & The number of rows per chunk. \\
\end{tabular}

\begin{tabular}{ll}
\textbf{Optional arguments to \texttt{\begin{longtable}}} \\
\texttt{none} & Position as specified by \texttt{\LTleft} and \texttt{\LTright}. \\
\texttt{[c]} & Centre the table. \\
\texttt{[l]} & Place the table flush left. \\
\texttt{[r]} & Place the table flush right. \\
\end{tabular}

\begin{tabular}{ll}
\textbf{Commands to end table rows} \\
\texttt{\textbackslash pagebreak} & Force a page break. \\
\texttt{\textbackslash pagebreak[\{val\}]} & A ‘hint’ between 0 and 4 of the desirability of a break. \\
\texttt{\textbackslash nopagebreak} & Prohibit a page break. \\
\texttt{\textbackslash nopagebreak[\{val\}]} & A ‘hint’ between 0 and 4 of the undesirability of a break. \\
\texttt{\textbackslash newpage} & Force a page break. \\
\end{tabular}

\begin{tabular}{ll}
\textbf{Footnote commands available inside \texttt{longtable}} \\
\texttt{\footnote} & Footnotes, but may not be used in the table head & foot. \\
\texttt{\footnotemark} & Footnotemark, may be used in the table head & foot. \\
\texttt{\footnotetext} & Footnote text, use in the table body. \\
\end{tabular}

\begin{tabular}{ll}
\textbf{Setlongtables} \\
\texttt{\setlongtables} & Obsolete command. Does nothing now. \\

9  The Macros

9.1  Initial code

Before declaring the package options, we must define some defaults here.

\LT@err  The error generating command
1 \def\LT@err\{\PackageError{longtable}\}

\LT@warn  The warning generating command
2 \def\LT@warn\{\PackageWarning{longtable}\}

\LT@final@warn  If any longtables have not aligned, generate a warning at the end of the run at \AtEndDocument.
3 \def\LT@final@warn\{\AtEndDocument\\LT@warn{Table \@width s have changed. Rerun LaTeX.\gobbletwo}\}

\LT@final@warn  If any longtables have not aligned, generate a warning at the end of the run at \AtEndDocument.
4 \def\LT@final@warn\%
5 \AtEndDocument\%
6 \LT@warn{Table \@width s have changed. Rerun LaTeX.\gobbletwo}\%
7 \global\let\LT@final@warn\relax

9.2  Options

The first two options deal with error handling. They are compatible with the options used by the tracefnt package.

errorshow  Only show errors on the terminal. ‘warnings’ are just sent to the log file.
8 \DeclareOption{errorshow}\{\def\LT@warn\{\PackageInfo{longtable}\}\}

pausing  Make every warning message into an error so \TeX stops. May be useful for de-bugging.
9 \DeclareOption{pausing}\{\def\LT@warn#1\{\LT@err#1{This is not really an error}\}\}

set final  The next options are just alternative syntax for the \setlongtables declaration.
10 \DeclareOption{set}\{}
11 \DeclareOption{final}\{}

12 \ProcessOptions

9.3  User Settable Parameters

\LTleft  Glue to the left and right of the table, default \fill (ie centred).
\LTright
13 \newskip\LTleft\LTleft=\fill
14 \newskip\LTright\LTright=\fill

\LTpre  Glue before and after the longtable. \bigskip by default.
\LTpost
15 \newskip\LTpre\LTpre=\bigskipamount
16 \newskip\LTpost\LTpost=\bigskipamount

\LTchunksize  Chunk size (The number of rows taken per \halign). Default 200.
\LTchunksize
17 \newcount\LTchunksize\LTchunksize=200
9.4 Internal Parameters

\LT@head Boxes for the table head and foot.
\LT@firsthead
\LT@foot
\LT@lastfoot
\LT@gbox
\LT@cols Counter for number of columns.
\LT@rows Counter for rows up to chunksize.
\c@LT@tables Counter for the tables, added in V3.02. Previous versions just used the \LaTeX{} counter \texttt{table}, but this fails if \texttt{table} is reset during a document, e.g., \texttt{report} class resets it every chapter.

This was changed from \texttt{\newcount\LT@tables} in V3.04. \LaTeX{} counters are preserved correctly when \texttt{\input{includeonly}} is used. In the rest of the file \texttt{\LT@tables} has been replaced by \texttt{\c@LT@tables} without further comment.

\c@LT@chunks We need to count through the chunks of our tables from Version 4 on.
\c@table \fnum@table \tablename
\LT@out In a normal style, longtable uses the \texttt{.aux} file to record the column widths. With \texttt{letter.sty}, use a separate \texttt{.lta} file. (Added in V3.06.)

Not needed for new letter class.
9.5 The \texttt{longtable} environment

\texttt{\textbf{longtable}} called by \texttt{\begin{longtable}}. This implementation does not work in multiple column formats. \texttt{\par} added at V3.04.

\begin{verbatim}
\def\longtable{\par
\ifx\multicols\@undefined
\else
\ifnum\col@number>1\@twocolumntrue
\fi
\fi
\if@twocolumn
\LT@err{longtable not in 1-column mode}\@ehc
\fi
\begingroup
\Check for an optional argument.
\@ifnextchar\[\LT@array\[x\]}
\LT@array
\end{verbatim}

\texttt{\textbf{\LT@array}} Start setting the alignment. Based on \texttt{\@array} from the \LaTeX{} kernel and the \texttt{array} package.

Since Version 3.02, \texttt{longtable} has used the internal counter \texttt{c\@LT@tables}. The \LaTeX{} counter \texttt{table} is still incremented so that \texttt{\caption} works correctly.

\begin{verbatim}
\def\LT@array[#1]{% \refstepcounter{table}\stepcounter{LT@tables}%
\if l#1\LTleft\z@ \LTright\fill
\else\if r#1\LTleft\fill \LTright\z@
\else\if c#1\LTleft\fill \LTright\fill
\fi\fi\fi
\LT@mcw@rn\relax
\let\LT@mcol\multicolumn
\end{verbatim}

Set up the glue around the table if an optional argument given.

\begin{verbatim}
\if l#1% \LTleft\z@ \LTright\fill
\else\if r#1% \LTleft\fill \LTright\z@
\else\if c#1% \LTleft\fill \LTright\fill
\fi\fi\fi
\LT@mcw@rn\relax
\let\LT@mcol\multicolumn
\end{verbatim}

Set up these internal commands for \texttt{longtable}.

\begin{verbatim}
\global\let\LT@mcol\multicolumn
\end{verbatim}
Now redefine \@tabarray to restore \hline and \multicolumn so that arrays and tabulars nested in longtable (or in page headings on longtable pages) work out OK. Saving the original definitions done here so that you can load the array package before or after longtable.

\let\LT@@tabarray\@tabarray
\let\LT@@hl\hline
\def\@tabarray{%
\let\hline\LT@@hl
\let\multicolumn\LT@mcol%
\let\LT@@tabarray\@tabarray%
\let\LT@tabularcr\LT@tabularcr
\let\ltabularnewline\%
\def\newpage{%
\noalign{\break}}%

More or less standard definitions, but first start a \noalign.
\def\pagebreak{%
\noalign{\ifnum'\fi\@testopt{\LT@no@pgbk-}4}%
\def\nopagebreak{%
\noalign{\ifnum'\fi\@testopt\LT@no@pgbk4}%

\LT@no@pgbk Can simplify the standard `\no@pgbk` as this is vmode only but then need to close
the \noalign.
\def\LT@no@pgbk#1[#2]{\penalty#1\getpen[#2]\ifnum'={0}\fi} \LT@start This macro starts the process of putting the table on the current page. It is not
called until either a `\` or `\endlongtable` command ends a chunk, as we do not
know until that point which of the four possible head or foot sections have been
specified.

It begins by redefining itself, so that the table is only started once! Until V3.04,
was redefined to \relax, now use \endgraf to force the page-breaker to wake up.
The second \endgraf is there so that \pagetotal is updated and so takes \LTpre
into account.
\def\LT@start{%
\let\LT@start\endgraf
\endgraf\penalty\z@\vskip\LTpre\endgraf
This next block was suggested by Lars Hellström in pr tools/3396 He documents
it as:

The original problem occurs because TeX has not yet found an awfully bad
(b=*) breakpoint and is therefore still collecting material to see if there is a really
longtable.sty

good break somewhere just ahead. As we know there aren’t, we want to make it
stop looking and break the page, so that \texttt{\pagetotal} will be for the page where
the table will actually end up. To achieve this, we need to give \TeX{} an awfully
bad, but legal, breakpoint. The simplest way of doing this seems to be to insert
a \texttt{\kern} that counters the \texttt{\pageshrink} for the page, followed by a \texttt{\penalty}
and a \texttt{\par} (to exercise the page builder). We also have to make sure that this
breakpoint doesn’t affect how the next page is broken, so we make the penalty
9999 (10000 is infinite and thus not a legal breakpoint) and cancel out the \texttt{\kern}
with a new \texttt{\kern}.

I don’t think this is the right solution to the problem (that would be that the
standard output routine has a feature for synchronizing with typesetting, as part
of the preparations for switching output routine), but it’s OK. Perhaps XOR will
make it better.

\begin{verbatim}
\ifdim \pagetotal<\pagegoal \else
  \dimen@=\pageshrink
  \advance \dimen@ 1sp %
  \kern\dimen@\penalty 9999\endgraf \kern-\dimen@
\fi
\end{verbatim}

Start a new page if there is not enough room for the table head, foot, and one
extra line.

\begin{verbatim}
\ifdim \pagetotal\advance\dimen@ \ht\ifvoid\LT@firsthead\LT@head\else\LT@firsthead\fi
  \advance\dimen@ \dp\ifvoid\LT@firsthead\LT@head\else\LT@firsthead\fi
  \advance\dimen@ \ht\LT@foot

\section{Counting Columns}

Columns are counted by examining \@preamble, rather than simply getting \@mkpream to increment the counter as it builds the preamble so that this package works with many of the packages which add extra column specifiers to \LaTeX’s standard ones.

Version 1 counted \@sharp’s to calculate the number of columns, this was changed for Version 2 as it does not work with the NFSS. Now count &’s.\footnote{(lfonts.new (and now the Standard \LaTeX definition) defines \@tabclassz so that \@sharp is inside a group.)}

\LT@nofcols  Find the next &, then look ahead to see what is next.
\LT@nofcols  Add one, then stop at an \LT@nofcols or look for the next &. The \expandafter trick was added in Version 3, also the name changed from \@LT@nofcols to preserve the \LT@ naming convention.
9.7 The `\` and `\kill` Commands

\LT@tabularcr The internal definition of `\`. In the `\*` form, insert a `\nobreak` after the next `\cr` (or `\crcr`).

This star form processing was finally added in v4.05. For the previous six or seven years the comment at this point said

This definition also accepts `\*`, which acts in the same way as `\`. `tabular` does this, but `longtable` probably ought to make `\*` prevent page breaking.

```
{\ifnum0='}\fi added in version 3.01, required if the first entry is empty.
```

The above in fact is not good enough, as with `array` package it can introduce a `{}` group in math mode, which changes the spacing. So use the following variant. Added in v3.14.

```
\protected\def\LT@tabularcr{%
  \relax\iffalse{\fi\ifnum0='}\fi\fi
  \@ifstar
    {\def\cr\cr\LT@tabularcr}
    {\LT@tabularcr}
}
```

\LT@crcr

```
\LT@setprevdepth This will be redefined to set the `\prevdepth` at the start of a chunk.
```

```
\LT@t@bularcr
197 \def\LT@t@bularcr{%
  Increment the counter, and do `tabular`'s `\` or finish the chunk.
  The `\expandafter` trick was added in Version 3. Set the `\prevdepth` at the start of a new chunk. (Done here so not set in header chunks).
  \global\advance\LT@rows\ ONE
  \ifnum\LT@rows=\LTchunksize
    \gdef\LT@setprevdepth{%
      \prevdepth\z@
      \global\let\LT@setprevdepth\relax
    }%
    \expandafter\LT@xtabularcr
  \else
    \ifnum0='{\fi
    \expandafter\LT@LL@FM@cr
    \fi}
}
```

\LT@xtabularcr

```
\LT@setprevdepth This just looks for an optional argument.
```

```
\LT@n@tabularcr
208 \def\LT@n@tabularcr{%
  \@ifnextchar[\LT@argtabularcr\LT@ntabularcr}
\LT@ntabularcr
The version with no optional argument. `\ifnum0='{\fi}` added in version 3.01. Changed in 3.14.
```

```
\LT@echunk
212 \LT@echunk
\LT@start
```

Page 19
The version with an optional argument.  `\ifnum0='{\fi}` added in version 3.01.  Changed in 3.14.

```
\def\LT@argtabularcr[#1]{%
  \ifnum0='{}\fi
  \ifdim #1>\z@\unskip\@xargarraycr{#1}%
  \else\@yargarraycr{#1}%\fi
  \LT@echunk
}
```

Add the dummy row, and finish the `\halign`.

```
\LT@echunk
\LT@start
\unvbox\z@
\LT@get@widths
\LT@bchunk}
```

This ends the current chunk, and removes the dummy row.

```
\def\LT@echunk{%
  \crcr\LT@save@row\cr\egroup
  \global\setbox\LT@gbox\lastbox
}
```

The following line was added in v4.05.  `longtable` relies on `\lineskip` glue (which is 0pt) to provide break points between each row so the table may be split into pages.

Previous releases left the `\lineskip` glue at the end of each chunk that had been added when the dummy row was added.  There was no glue at the start of the next chunk as TeX normally does not put `\lineskip` glue at the top of a box.  This meant that normally the chunks fitted together perfectly, however `\noalign` material at a chunk boundary came before the first row of the next chunk but after the lineskip glue at the end of this chunk.  This is the wrong place, e.g., it means even a `\penalty10000` does not stop a break as the `\lineskip` glue in the previous item on the list provides a legal breakpoint.  So now remove the `\lineskip` glue that was before the dummy row and introduce `\LT@setprevdepth` to set the `\prevdepth` at the start of the next chunk, to make sure `\lineskip` glue is added later.

```
\unskip
\egroup}
```

We here give the ‘basic’ definition of `\LT@entry`, namely that used in alignment templates.  It has a `\kern` only if the maximum is imposed from a different chunk.  The `\ifhmode` test reveals the first entry, when we don’t want to add an `&`.

```
\def\LT@entry#1#2{%
  \ifhmode\@firstofone{&}\fi\omit
  \ifnum#1=\c@LT@chunks\else\kern#2\relax\fi}
```

We here give the ‘basic’ definition of `\LT@entry`, namely that used in alignment templates.  It has a `\kern` only if the maximum is imposed from a different chunk.  The `\ifhmode` test reveals the first entry, when we don’t want to add an `&`.

```
\def\LT@entry#1#2{%
  \ifhmode\@firstofone{&}\fi\omit
  \ifnum#1=\c@LT@chunks\else\kern#2\relax\fi}
```
\LT@entry@chop This definition for the argument of \LT@save@row is used to scrap all those maxima which could not be verified because they occur after the end of the table. This can happen only if a table has been shortened (or the sequencing got mixed up) since the previous run. Note that this is premature: the last chunk still is going to be set, and with the chopped limits.

\LT@entry@write To write an entry for the aux file, we use a slightly surprising definition which has the sole purpose of avoiding overfull lines (which might break \TeX’s limits when reading the aux file, probably you’d need to have a few hundred columns before this happened but...).)

\LT@kill This ends the current chunk as above, but strips off two rows, the ‘dummy row’ and the ‘killed row’ before starting the next chunk. Since V3.04, the old chunk is reboxed at the start of the box containing the next chunk. This allows \kill to be used in headers, which must be processed in a single box.

\LT@rebox Drop the old chunk (box0) back at the top of the new chunk, removing the killed row. This macro added at V3.04.

9.8 The Dummy Row
The dummy row is kept inside of the macro \LT@save@row.

\LT@blank@row \LT@build@blank Create a blank row if we are not using the info in the .aux file.

Whoops! What’s that supposed to be? A drop-in replacement for the first task of Appendix D in the \TeXbook. The \romannumeral produces \LT@cols instances of m followed by i. The below macro then replaces the m’s by appropriate entries.
Prior to version 4, by default did not use information in the `.aux` file but now we can define \LT@make@row to use the `.aux` file, even on the ‘draft’ passes.

\LT@make@row

Now a slightly difficult part comes. Before we decide making the template from the `.aux` file info we check that the number of fields has remained the same. If it hasn’t, either the table format has changed, or we have the wrong table altogether. In both cases, we decide to better drop all gathered information and start over.

The expansion between `!` below will be empty if the number of \LT@entry macros including arguments in \LT@save@row is equal to \LT@cols. If it is not empty, we throw the row away and start from scratch.

\setlongtables

Redefine \LT@make@row to use information in the `.aux` file, if there is a saved row for this table with the right number of columns.

Since Version 3.02, longtable has used the internal counter `c@LT@tables` rather than the \LaTeX counter `table`. The warning message was added at V3.04, as was the \global, to stop save-stack overflow.

Since Version 4.01 \setlongtables does nothing as it is not needed, but is defined as \relax for the benefit of old documents.

\LT@get@widths

This is the heart of longtable. If it were not for the table head and foot, this macro together with the modified `\` command would form the basis of quite a simple little package file for long tables. It is closely modelled on the `\endvrulealign` macro of appendix D of the \TeXbook.
\LT@def@row  Add a column to the dummy row. Name changed from \defLT@save@row in Version 3, to preserve the \LT@ naming convention.

\LT@max@sel  And this is how to select the right combination. Note that we take the old maximum information only if the size does not change in either direction. If the size has grown, we of course have a new maximum. If the size has shrunk, the old maximum (which was explicitly not enforced because of being in the current chunk) is invalid, and we start with this chunk as the new size. Note that even in the case of equality we must use the \the\wd\tw@ construct instead of \#2 because \#2 might be read in from the file, and so could have \catcode 11 versions of p and t in it which we want to be replaced by their ‘proper’ \catcode 12 versions.
\LT@hline  \hline and \hline\hline both produce two lines. The only difference being the glue and penalties between them. This is so that a page break at a \hline produces a line on both pages.\footnote{\longtable has always done this, but perhaps it would be better if hlines were omitted at a page break, as the head and foot usually put a hline here anyway.} Also this \hline is more like a \cline{1-\LT@cols}. tabular's \hline would draw lines the full width of the page.
\LT@caption  The caption is \multicolumn{\LT@cols}{c}{\{a parbox with the table’s caption\}}
\LT@c@ption  Caption command (with \protect\optional argument). \protect added in Version 3. \fnum@table added at V3.05.
\LT@c@ption  Caption command (no \optional argument)
Put the caption in a box of width 0pt, so that it never affects the column widths. Inside that is a \parbox of width \LTcapwidth.

Based on article class \@makecaption, \#1 is \@gobble in star form, and \@firstofone otherwise.

\LT@output

Actually this is not so bad, with FM leading the way.

The last foot might not fit, so: 7

An alternative would be to vsplit off a bit of the last chunk, so that the last page did not just have head and foot sections, but it is hard to do this in a consistent manner.

\LT@output

Actually this is not so bad, with FM leading the way.

The last foot might not fit, so: 7

An alternative would be to vsplit off a bit of the last chunk, so that the last page did not just have head and foot sections, but it is hard to do this in a consistent manner.
Reset \@colroom.

\global\@colroom\@colht
\global\vsize\@colht

Put the last page of the table on to the main vertical list.
\unvbox\z@\box\ifvoid\LT@lastfoot\LT@foot\else\LT@lastfoot\fi

End of \ifnum\outputpenalty > \LT@end@pen.
\fi

Else \outputpenalty > -\@Mi.
\else
If we have not reached the end of the table,
\setbox\@cclv\vbox{\unvbox\@cclv\copy\LT@foot\vss}\
\@makecol
\@outputpage

Reset \vsize.
\global\vsize\@colroom

Put the head at the top of the next page.
\copy\LT@head\nobreak

End of \ifnum\outputpenalty <-\@Mi.
\fi}

9.12 Commands for the table head and foot

\LT@end@hd@ft The core of \endhead and friends. Store the current chunk in the box specified by #1. Issue an error if the table has already started. Then start a new chunk.
\def\LT@end@hd@ft#1{\LT@echunk
\ifx\LT@start\endgraf
\LT@err
{Longtable head or foot not at start of table}\
{Increase LTchunksize}\
\fi
\setbox#1\box\z@
\LT@get@widths
\LT@bchunk}

\endfirsthead Call \LT@end@hd@ft with the appropriate box.
\endhead
\endfoot
\endlastfoot

9.13 The \multicolumn command

Earlier versions needed a special ‘draft’ form of \multicolumn. This is not needed in version 4, and so these commands have been removed.
9.14 Footnotes

The standard \footnote command works in a \(c\) column, but we need to modify the definition in a \(p\) column to overcome the extra level of boxing. These macros are based on the \texttt{array} package, but should be OK for the standard \texttt{tabular}.

\LT@startpbox Add extra code to switch the definition of \texttt{@footnotetext}.
410 \def\LT@startpbox#1{% 411 \begingroup 412 \color@begingroup 413 \let\@footnotetext\LT@p@ftntext 414 \setlength\hsize{#1} 415 \@arrayparboxrestore 416 \vrule \height \ht\@arstrutbox \width \z@}

\LT@endpbox After the parbox is closed, expand \texttt{@p@ftn} which will execute a series of \footnotetext\{⟨num⟩\}{⟨note⟩} commands. After being lifted out of the parbox, they can migrate on their own from here.
417 \def\LT@endpbox{% 418 \finalstrut\@arstrutbox 419 \color@endgroup 420 \egroup 421 \the\LT@p@ftn 422 \global\LT@p@ftn{}% 423 \hfil}

\LT@p@ftntext Inside the ‘\texttt{p}’ column, just save up the footnote text in a token register.
424 \long\def\LT@p@ftntext#1{% 425 \edef\@tempa{\the\LT@p@ftn\noexpand\footnotetext[\the\c@footnote]{⟨note⟩}}% 426 \global\LT@p@ftn\expandafter{\@tempa(#1)}}% 427 (/package)
